Introduction

- Proving olympiad-level math theorems is hard, even for top young mathematicians. Most AI can't do it because translating human proofs to machine format is costly and especially difficult in geometry.
- AlphaGeometry is a new AI system that doesn't need human-written proofs. It creates its own huge dataset of geometry theorems and proofs, then uses a special language model to guide a logic engine through solving new problems.
- AlphaGeometry is good! It solves 25 out of 30 recent olympiad problems, better than any other AI and close to an average IMO gold medalist.
- AlphaGeometry can explain its proofs in a way humans can understand and even discovered a new theorem!

Approaching the Olympiad gold-medalist standard

AlphaGeometry

a A simple problem

"Let ABC be any triangle with $AB = AC$.
Prove that $\angle ABC = \angle BCA$."

b AlphaGeometry

c Language model

d Solution

Construct D: midpoint BC,

$AB=AC, BD = DC, AD=AD \Rightarrow \angle ABD = \angle DCA$ [1]

[1], B C D collinear $\Rightarrow \angle ABC = \angle BCA$

- AlphaGeometry solving an Olympiad problem: Problem 3 of the 2015 International Mathematics Olympiad (left) and a condensed version of AlphaGeometry's solution (right). The blue elements are added constructs. AlphaGeometry's solution has 109 logical steps.

IMO 2015 P3

Let ABC be an acute triangle. Let (O) be its circumcircle, H its orthocenter, and F the foot of the altitude from A . Let M be the midpoint of BC . Let Q be the point on (O) such that $QH \perp QA$ and let K be the point on (O) such that $KH \perp KQ$. Prove that the circumcircles (O_1) and (O_2) of triangles FKM and KQH are tangent to each other.

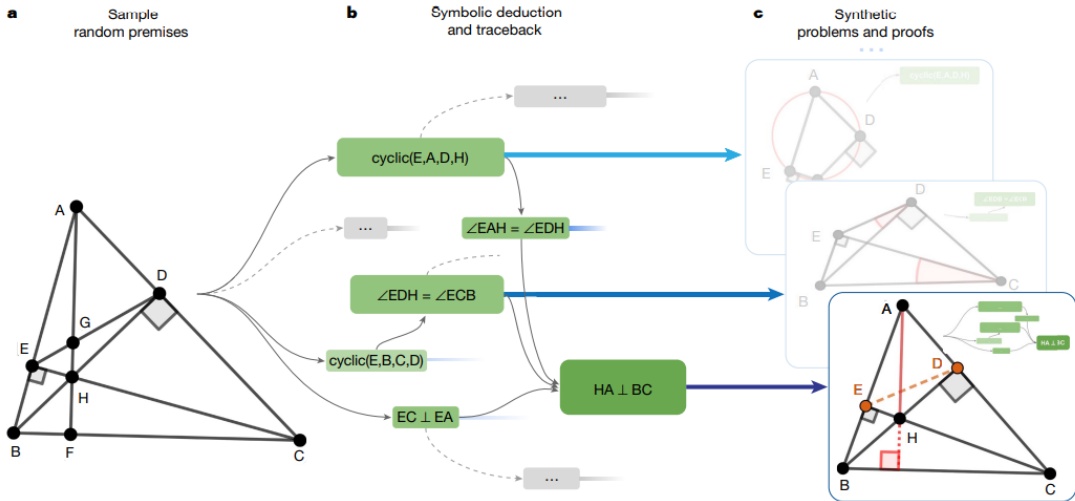

AlphaGeometry

Solution

```
[...]
Construct D: midpoint BH [a]
[a], O2 midpoint HQ ⇒ BQ ∥ O2D [20]
[...]
Construct G: midpoint HC [b]
∠GMD = ∠GO2D ⇒ M O2 G D cyclic [26]
[...]
[a], [b] ⇒ BC ∥ DG [30]
[...]
Construct E: midpoint MK [c]
[c] ⇒ ∠KFC = ∠KO1E [104]
[...]
∠FKO1 = ∠FKO2 ⇒ KO1 ∥ KO2 [109]
[109] ⇒ O1 O2 K collinear ⇒ (O1)(O2) tangent
```

Synthetic data generation process

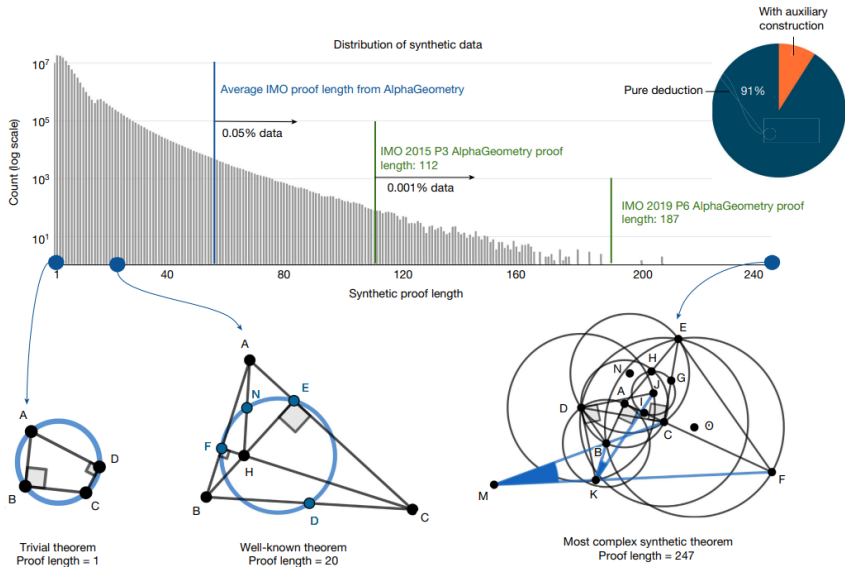

Synthetic Data

Visual representations of the synthetic data generated by AlphaGeometry

Experimental Results

Method		Problems solved (out of 30)
Computer algebra	Wu's method ²¹ (previous state of the art)	10
	Gröbner basis ²⁰	4
Search (human-like)	GPT-4 (ref. 25)	0
	Full-angle method ³⁰	2
	Deductive database (DD) ¹⁰	7
	DD+human-designed heuristics ¹⁷	9
	DD+AR (ours)	14
	DD+AR+GPT-4 auxiliary constructions	15
	DD+AR+human-designed heuristics	18
	AlphaGeometry	25

Conclusion

1. **Modular Deductive Reasoning:** AlphaGeometry demonstrates the effectiveness of decomposing complex mathematical challenges into manageable subproblems. It then utilizes a combination of deduction and construction techniques to achieve solutions, highlighting the importance of structured, step-by-step reasoning in tackling intricate tasks.
2. **Strategic Synthetic Data Generation:** The success of AlphaGeometry underscores the potential of synthetic data generation, particularly when designed with worst-case scenarios in mind. By pre-training on a diverse set of synthetically generated theorems and proofs, the system equips itself to handle a wider range of real-world problems not yet encountered. (ICR)
3. **LLM Guidance:** AlphaGeometry showcases the value of employing large language models (LLMs) not simply as answer generators, but as strategic guides for symbolic deduction engines. By leveraging the LLM's knowledge of geometric relationships and problem-solving patterns, the system navigates the vast solution space more efficiently and effectively. (Agents)
